

Exercise 4: Iterative PCA (10 P)

When performing principal component analysis, computing the full eigendecomposition of the scatter matrix \mathbf{S} is typically slow, and we are often only interested in the first principal components. An efficient procedure to find the first principal component is *power iteration*. It starts with a random unit vector $\mathbf{w}^{(0)} \in \mathbb{R}^d$, and iteratively applies the parameter update

$$\mathbf{w}^{(t+1)} = \mathbf{S}\mathbf{w}^{(t)} / \|\mathbf{S}\mathbf{w}^{(t)}\|$$

until some convergence criterion is met. Here, we would like to show the exponential convergence of power iteration. For this, we look at the error terms

$$\mathcal{E}_k(\mathbf{w}) = \left| \frac{\mathbf{w}^\top \mathbf{u}_k}{\mathbf{w}^\top \mathbf{u}_1} \right| \quad \text{with } k = 2, \dots, d,$$

and observe that they should all converge to zero as \mathbf{w} approaches the eigenvector \mathbf{u}_1 and becomes orthogonal to other eigenvectors.

- (a) Show that $\mathcal{E}_k(\mathbf{w}^{(T)}) = |\lambda_k/\lambda_1|^T \cdot \mathcal{E}_k(\mathbf{w}^{(0)})$, i.e. the convergence of the algorithm is exponential with the number of time steps T .

Proof by induction:

1) For $T=0$, it is clearly true

$$\begin{aligned} \text{let } T=1, \text{ then } \mathcal{E}_k(\mathbf{w}^{(1)}) &= \left| \frac{\mathbf{w}^{(1)\top} \mathbf{u}_k}{\mathbf{w}^{(0)\top} \mathbf{u}_1} \right| = \left| \frac{(\mathbf{S}\mathbf{w}^{(0)})^\top \mathbf{u}_k}{(\mathbf{S}\mathbf{w}^{(0)})^\top \mathbf{u}_1} \right| = \left| \frac{\mathbf{w}^{(0)\top} \overbrace{\mathbf{S}^\top \mathbf{u}_k}^{\lambda_k \mathbf{u}_k}}{\mathbf{w}^{(0)\top} \overbrace{\mathbf{S}^\top \mathbf{u}_1}^{\lambda_1 \mathbf{u}_1}} \right| = \left| \frac{\lambda_k}{\lambda_1} \right| \cdot \left| \frac{\mathbf{w}^{(0)\top} \mathbf{u}_k}{\mathbf{w}^{(0)\top} \mathbf{u}_1} \right| \\ &= \left| \frac{\lambda_k}{\lambda_1} \right| \mathcal{E}_k(\mathbf{w}^{(0)}) \end{aligned}$$

2) Assume that for some $T \geq 0$ we have $\mathcal{E}_k(\mathbf{w}^T) = \left| \frac{\lambda_k}{\lambda_1} \right|^T \mathcal{E}_k(\mathbf{w}^{(0)})$

$$\begin{aligned} 3) \quad \mathcal{E}_k(\mathbf{w}^{(T+1)}) &= \left| \frac{\mathbf{w}^{(T+1)\top} \mathbf{u}_k}{\mathbf{w}^{(T)\top} \mathbf{u}_1} \right| = \left| \frac{(\mathbf{S}\mathbf{w}^{(T)})^\top \mathbf{u}_k}{(\mathbf{S}\mathbf{w}^{(T)})^\top \mathbf{u}_1} \right| = \left| \frac{\mathbf{w}^{(T)\top} \overbrace{\mathbf{S}^\top \mathbf{u}_k}^{\lambda_k \mathbf{u}_k}}{\mathbf{w}^{(T)\top} \overbrace{\mathbf{S}^\top \mathbf{u}_1}^{\lambda_1 \mathbf{u}_1}} \right| = \left| \frac{\lambda_k}{\lambda_1} \right| \cdot \left| \frac{\mathbf{w}^{(T)\top} \mathbf{u}_k}{\mathbf{w}^{(T)\top} \mathbf{u}_1} \right| = \\ &\stackrel{\text{hypothesis}}{=} \left| \frac{\lambda_k}{\lambda_1} \right|^{T+1} \cdot \mathcal{E}_k(\mathbf{w}^{(0)}) \end{aligned}$$

Using mathematical induction, we have proven that $\forall T \in \mathbb{N}$

$$\mathcal{E}_k(\mathbf{w}^T) = \left| \frac{\lambda_k}{\lambda_1} \right|^T \mathcal{E}_k(\mathbf{w}^{(0)})$$

□
